

Migrate into SAP S4HANA for a better future

All know about the SAP and SAP S/4HANA is quickly becoming SAP's most successful ERP system.

S/4HANA is that the 4th ERP suite developed by SAP. For over four decades, enterprise resource planning (ERP) software has been the core of SAP. So what's special about S/4HANA compared to the previous generations of SAP ERP systems?

SAP S/4HANA's primary differentiator is its unique architecture which is quite a contrast from the classic relational database. It runs in-memory, with data stored in columns, allowing faster, accurate real-time analytics and compute capabilities. Most business users are conscious of the SAP S/4HANA benefits that are key value adds, but it also provides users with including, but not limited to; simplification and centralization to management and administration, simple use, cost-effectiveness, innovation, improved performance and speed, and an overall simple transition from on-premise to cloud.

SAP has announced that it'll stop providing support for the legacy ECC systems from 2025 so although it does involve financial and technical risks, all customers- small, medium, and large should actively consider moving or planning a smooth transition into SAP S/4 HANA.

SAP is one of the foremost prolific enterprise resources designing code accessible straight away. The German company's software system is powering thousands of corporations all over the planet nowadays. a big development for individuals exploitation SAP is that the introduction of SAP S/4HANA. The new application from the house of SAP permits users to use in-memory information technology that enables the application to process huge amounts of knowledge in real-time. The technology is revolutionary as a result of it'll enable the engine to method knowledge stored in RAM, that improves the speed drastically as hostile reading the information from a disk.

The steps to require whereas migrating towards SAP S4/HANA

- Determine the right size of the HANA landscape
- Choose the right platform and confirm the most effective migration strategy

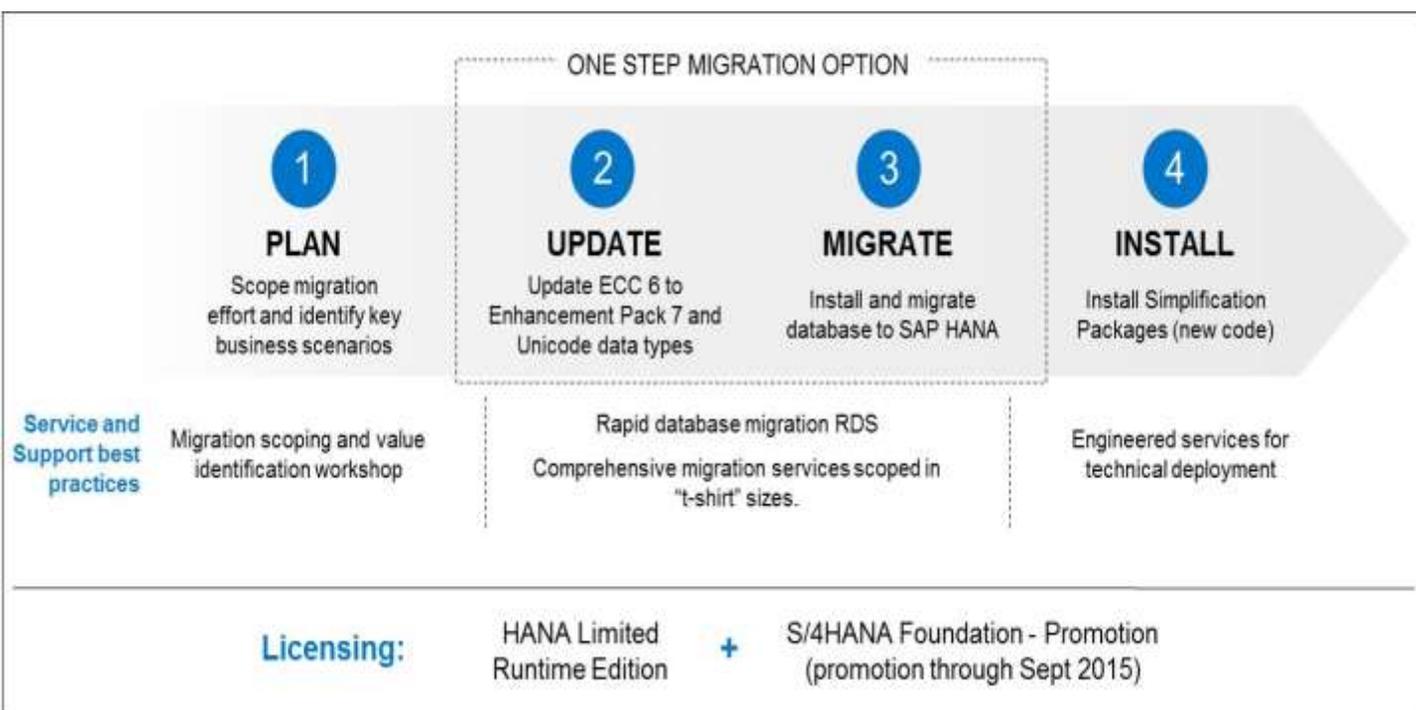

There are primarily 2 approaches to SAP HANA implementation.

- Within the Greenfield approach, a corporation decides to implement SAP S/4HANA from scratch. the disadvantage of this method is that it's considerably long and tiresome; whereas the advantage is that you simply have the freedom of coming up with a brand new system entirely from scratch.
 - in an exceedingly Brownfield approach, a corporation decides to convert and upgrade the present system to create it compatible with SAP S/4HANA.
-

Best knowledge migration practices to follow whereas migrating to SAP S/4HANA

The Greenfield Approach :

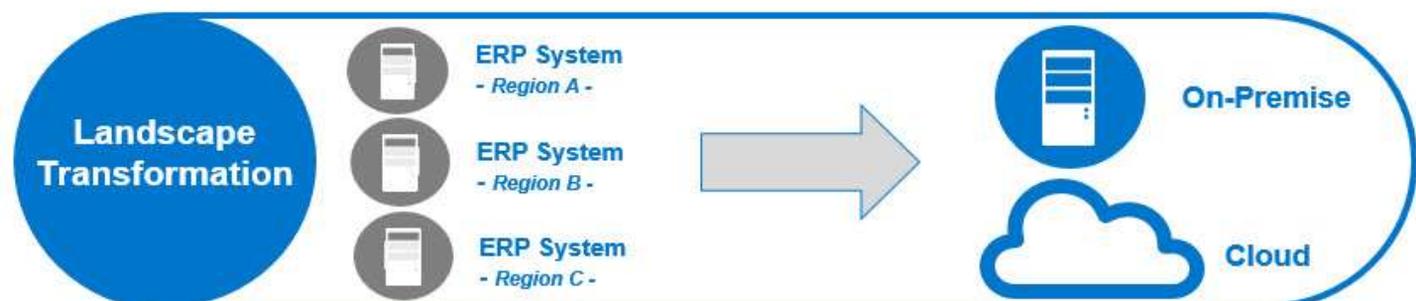

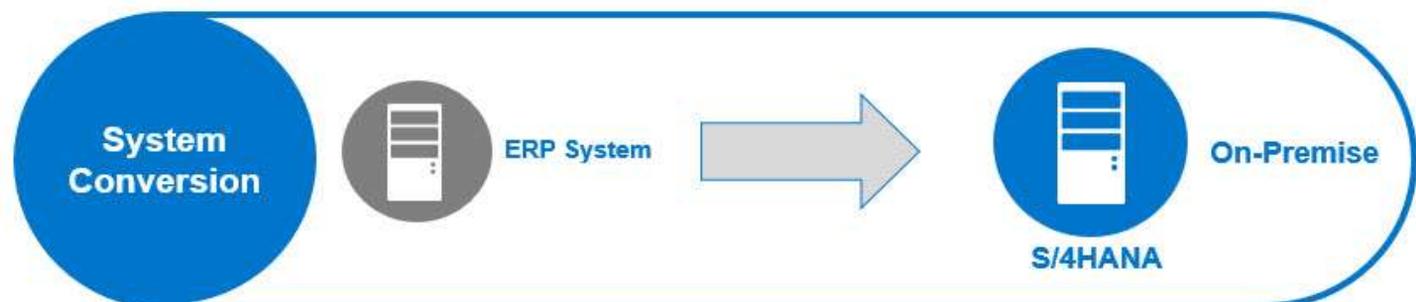

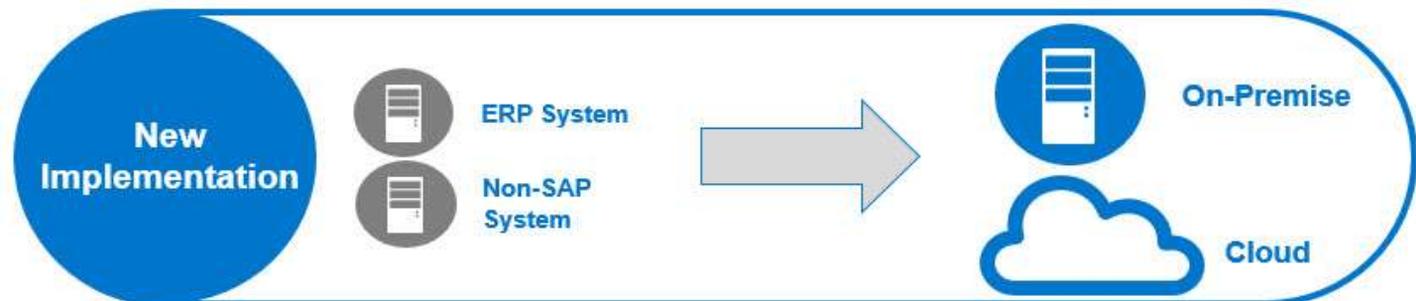

The greenfield approach requires a new implementation of SAP S/4HANA. this could be a slow and long project, particularly on the modification management facet, since you've got to begin everything from scratch. The top to the present path is that you simply will redefine and change the business processes and take full advantage of S/4HANA capabilities. This doesn't guarantee that the recently enforced system can really work on the operational facet, however there'll be time for adjustment.

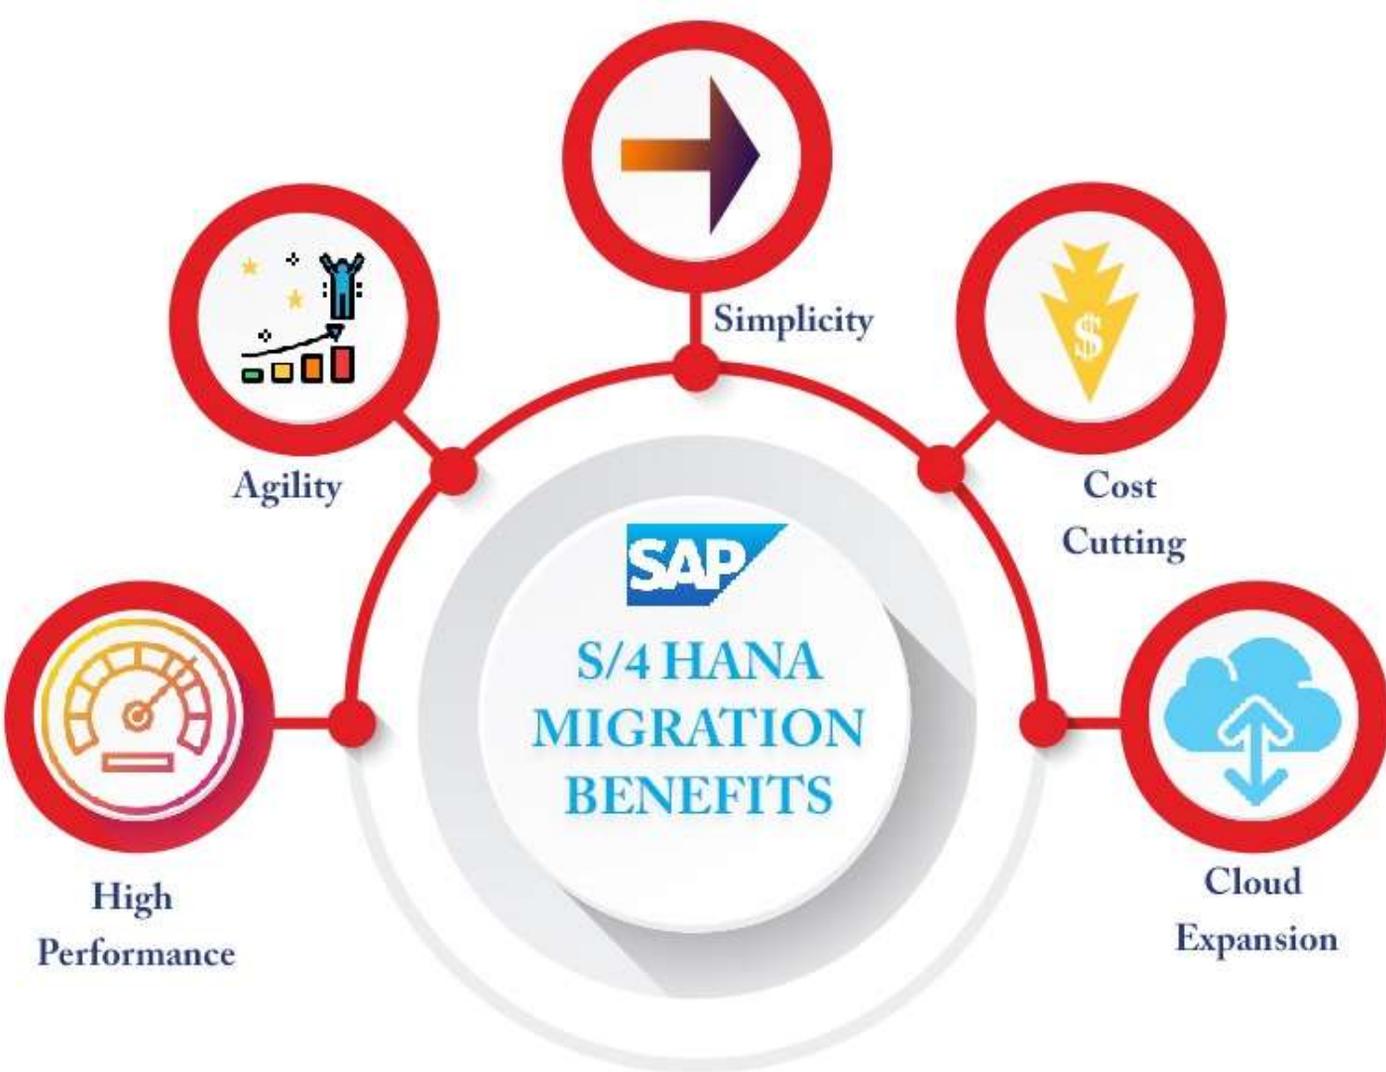

The Brownfield Approach :

With all the repercussions of the greenfield approach, there's an alternate way: the brownfield route. this can be SAP's recommendation for existing customers who are in operation on SAP ecc and wish to migrate to S/4HANA however still keep their investment within the current system.

With system conversion, you'll move the full system and business method to a brand new platform of S/4HANA. This approach offers a much better answer if you don't need any changes within the operations of your business method.

Benefits

- Deliver migration comes on time and at intervals budget
- Guarantee quality master knowledge for your core business processes
- Validate the data against specific client business rules
- Load knowledge into your SAP S/4HANA system

Overall, the essential benefits of migrating or getting into the SAP S/4 HANA system for a customer using ECC is extremely high. there's definitely doubt whether a customer must completely switch to HANA or have a mixture of both ECC and HANA, except for better system performance and an overall improvement ineffectiveness, the sooner a customer switches to HANA the higher it's for them.
